## IN THE CLAIMS

1. (currently amended) A method for automating the personalization of a batch of smart cards, said method comprising:

executing a personalization assistant software tool, said software tool including a default member profile having default values for smart card features;

providing a user with a plurality of queries regarding said smart card features, said queries originating from said software tool;

receiving from the user responses to the plurality of queries, said responses being received by said software tool; and

matching each of said responses with an output data value, said matching being performed by said software tool:

modifying said default member profile using said matched output data values;

generating a personalization data file from said default member profile and said output data values using the responses to the plurality of queries, wherein the output data values of said personalization data file comprises values are, which may be used to provide said smart card features on said a batch of smart cards when said batch of smart cards is personalized.

- 2. (currently amended) The method, as recited in claim 1, further comprising using individual <u>cardholder</u> eard holder input files and the personalization data file to personalize a plurality of smart cards to yield a plurality of personalized smart <u>cards</u> eard.
- 3. (currently amended) The method, as recited in claim 2, wherein the generating a personalization data file, comprises:

providing a look up table with entries for various combinations of responses to the plurality of queries;

finding a matching entry in the look up table that matches the responses to the plurality of queries;

locating personalization data file output associated with the matching entry; and outputting the personalization data file output associated with to the matching entry.

4. (original) The method, as recited in claim 3, wherein the plurality of queries, comprise:

at least one query regarding smart card account usage control;

at least one query regarding smart card account risk management; and

at least one query regarding offline limits and thresholds.

- 5. (original) The method, as recited in claim 4, wherein responses to the plurality of queries are used to provide best practices recommendations.
- 6. (original) The method, as recited in claim 5, further comprising providing regional profiles and subregional profiles, wherein a subregion is within a region, wherein the regional and subregional profiles have mandatory and recommended settings, wherein some of the subregional profiles are more stringent than regional profiles in which the subregions belong.
- 7. (currently amended) The method, as recited in claim 1, wherein the generating a personalization data file, comprises:

providing a look up table with entries for various combinations of responses to the plurality of querics;

finding a matching entry in the look up table that matches the responses to the plurality of queries;

locating personalization data file output associated with the matching entry; and outputting the personalization data file output associated with to the matching entry.

- The method, as recited in claim 1, wherein the plurality of queries, (original) 8. comprise:
  - at least one query regarding smart card account usage control; at least one query regarding smart card account risk management; and at least one query regarding offline limits and thresholds.
- The method, as recited in claim 1, wherein responses to the plurality of (original) 9. queries are used to provide best practices recommendations.
- The method, as recited in claim 1, further comprising providing regional (original) 10. profiles and subregional profiles, wherein a subregion is within a region, wherein the regional and subregional profiles have mandatory and recommended settings, wherein some of the subregional profiles are more stringent than regional profiles in which the subregions belong.

11. (currently amended) A computer implemented method for automating the personalization of a batch of smart cards, comprising:

running on a host computer a personalization assistant software application, said software application including a default member profile having default values for smart card features;

providing to at least one user system over a network a plurality of queries regarding smart card features, said queries originating from said software application;

receiving from the at least one user system over the network responses to the plurality of queries, said responses being received by said software application;

matching each of said responses with an output data value, said matching being performed by said software application;

modifying said default member profile using said matched output data values:

generating a personalization data file from said default member profile and said output data values using the response to the plurality of queries, wherein the output data values of said personalization data file comprises values are which may be used to provide said smart card features on said a batch of smart cards when said batch of smart cards is personalized.

12. (currently amended) The computer implemented method, as recited in claim 11, further comprising:

sending the personalization data file to a preparation processing device; and using the personalization data file and <u>cardholder</u> eard holder input files to personalize smart cards.

13. (currently amended) The computer implemented method, as recited in claim 12, wherein the generating a personalization data file, comprises:

providing a look up table with entries for various combinations of responses to the plurality of queries;

finding a matching entry in the look up table that matches the responses to the plurality of queries;

locating personalization data file output associated with the matching entry; and outputting the personalization data file output associated with to the matching entry.

- 14. (original) The computer implemented method, as recited in claim 13, wherein the plurality of queries, comprise:
  - at least one query regarding smart card account usage control;
  - at least one query regarding smart card account risk management; and
  - at least one query regarding offline limits and thresholds.
  - 15. (original) The computer implemented method, as recited in claim 14, wherein responses to the plurality of queries are used to provide best practices recommendations.
  - 16. (original) The computer implemented method, as recited in claim 15, further comprising providing regional profiles and subregional profiles, wherein a subregion is within a region, wherein the regional and subregional profiles have mandatory and recommended settings, wherein some of the subregional profiles are more stringent than regional profiles in which the subregions belong.
  - 17. (currently amended) The computer implemented method, as recited in claim 11, wherein the generating a personalization data file, comprises:

providing a look up table with entries for various combinations of responses to the plurality of queries;

finding a matching entry in the look up table that matches the responses to the plurality of queries;

locating personalization data file output associated with the matching entry; and outputting the personalization data file output associated with to the matching entry.

18. (original) The computer implemented method, as recited in claim 11, wherein the plurality of queries, comprise:

at least one query regarding smart card account usage control; at least one query regarding smart card account risk management; and at least one query regarding offline limits and thresholds.

- 19. (original) The computer implemented method, as recited in claim 11, wherein responses to the plurality of queries are used to provide best practices recommendations.
- 20. (original) The computer implemented method, as recited in claim 11, further comprising providing regional profiles and subregional profiles, wherein a subregion is within a region, wherein the regional and subregional profiles have mandatory and recommended settings, wherein some of the subregional profiles are more stringent than regional profiles in which the subregions belong.
- 21.-35. (cancelled)
